

Trees of the World

Ash

The ash tree is known for its strong, flexible wood, often used to make tool handles and sports equipment. It has compound leaves and produces winged seeds called samaras.

Birch

Birch trees are recognized by their distinctive white, papery bark that peels in thin layers. They thrive in cool climates and are often planted for their elegant appearance.

Cedar

Cedar trees are evergreen conifers valued for their aromatic, decay-resistant wood. They grow tall and straight, with fragrant needles that repel insects naturally.

Elm

Elm trees have a graceful, vase-like shape and serrated leaves. Many elm populations were devastated by Dutch elm disease, though resistant varieties are now being planted.

Fir

Fir trees are conifers with flat, soft needles and upright cones. They are popular choices for Christmas trees due to their symmetrical shape and pleasant scent.

Maple

Maple trees are famous for their vibrant autumn foliage and, in some species, sap that can be boiled into maple syrup. Their leaves have a distinctive lobed shape.

Oak

Oak trees are long-lived and sturdy, producing acorns as their seeds. Their wood is prized for furniture and flooring due to its strength and attractive grain.

Pine

Pine trees are evergreen conifers with long, slender needles grouped in bundles. They produce woody cones and are widely used for lumber and paper production.

Willow

Willow trees often grow near water and are known for their slender, drooping branches. Their flexible wood has traditionally been used for basket weaving.
